Data Analytics Task Using Tableau for Operational:

The objective of this task is to analyze operational and performance data using Tableau. The analysis aims to evaluate productivity, operational efficiency, and key performance indicators to support data-driven decision-making within an organization

What I done:

In this project, I built an operations performance dashboard in Tableau using data about departments, employees, and daily tasks. I created calculated fields such as task completion rate and productivity per hour to measure how efficiently work is getting done. Using these metrics, I developed visualizations for department-wise task completion, productivity by department, monthly trends in tasks completed, workload distribution across teams, and the relationship between employee salary and performance scores. Finally, I combined these views into an interactive dashboard with KPI cards and filters for date, department, and location so that managers can quickly see which departments are performing well, where workloads are high, and how performance changes over time.
